След обновяване на php, **phpMyAdmin** започва да показва грешки, които са безобидни, но спират изцяло работата на инструмента. Дори понякога да свалите и инсталирате най-новата версия, тези грешки може все още да се показват.

Къде да поставите този код (и защо config.inc.php не работи)

Може да си помислите, че най-доброто място да добавите този ред е в **config.inc.php**, но това не работи по някаква причина. Вместо това трябва да го добавите във файла **libraries/constants.php**, за да може phpMyAdmin да го разпознае.

Стъпки:

Отворете директорията на вашата phpMyAdmin инсталация.

Намерете и отворете файла libraries/constants.php.

Добавете следния код в началото на файла (след отварящия PHP таг <?php), НО ако има declare(strict_types=1); след този ред.

```
error_reporting(E_ALL & ~E_WARNING & ~E_NOTICE & ~E_STRICT & ~E_DEPRECATED);
```

Запазете файла и презаредете phpMyAdmin в браузъра си. Грешките би трябвало да изчезнат.
